

The VPN for Your Office, SMB, or Enterprise Is Forked. We Unfork It.

Why VPN Is Forked

If your access path looks like spaghetti, that's forked. And fixable. VPN wasn't built for SaaS, hybrid work, cloud apps, or modern threats. So, it creates problems you shouldn't have to tolerate:

- Slow, backhauled connections
- Overexposed internal network
- Excessive lateral movement
- Too many vendors
- Heavy operational overhead

Managed SASE. The Cleaner Way to Connect.

TPx gives your users secure, identity-based, direct-to-app access. No tunnels, no detours, no network exposure. We manage the rollout, the integration, and the day-to-day operations so you don't have to.

- ✓ No broken integrations
- ✓ No months-long deployments
- ✓ No team overload
- ✓ No vendor sprawl
- ✓ No backhauling

A Safe, Predictable Transition off VPN

Some teams hesitate to replace VPN because they worry something will break. TPx eliminates that risk with a fully managed approach.

3-Step Unforking Path:

- 1. Assess & Map:** We review your network, tools, policies, and identity systems.
- 2. Deploy & Optimize:** We integrate SASE cleanly, and handle all the sequencing, and onboard users without disruption.
- 3. Manage & Support:** We monitor it 24/7, tune performance, and keep policies aligned with quarterly business reviews.

Secure, Fast, Managed. Fully Unforked.

- Zero-trust access mapped to identity
- Direct-to-app performance
- Unified networking + security
- Fully managed operations
- Lower attack surface
- Predictable per-user cost
- Simplified architecture
- Less complexity. Less risk.
- Faster access. More time back for your team.

Why IT Leaders Choose TPx to Unfork Their Access

Decades of experience managing complex networks and supporting thousands of customers with 24/7 monitoring and expert engineering. Our proven migration playbooks ensure a seamless transition, while predictable OPEX pricing eliminates surprise CAPEX investments.

- **For CIOs:** Scale securely without slowing the business.
- **For Infrastructure Leaders:** Fewer tunnels. Fewer vendors. Fewer headaches.
- **For Security Teams:** No more “too much access.” Identity-first protection.

Frequently Asked Questions

Question	Answer	Further Detail
Q: My VPN is not forked.	A: Yes, it is. You just haven't experienced the unforked version yet.	When you experience secure, direct-to-app access, the difference is obvious. Backhauling traffic, exposing your network, and slowing down every app is the definition of “forked.” Managed SASE removes the detours, choke points, and drama.
Q: Who is the Unforker?	A: TPx – after 25 years of working with forked networks, we built the solution that unforks them.	We've supported thousands of businesses through complex networking and security challenges. TPx Managed SASE delivers clean, modern, zero-trust access without the heavy lifting.
Q: Does it cost money?	A: Of course. It costs \$20 per employee. A little more than unsecure access, but not as much as your current forked VPN.	TPx Managed SASE replaces multiple tools, aging VPN gear, and endless troubleshooting with one predictable per-user service that's safer, faster, and more cost-efficient.
Q: Why are VPNs forked?	A: Because modern work has outgrown them.	VPNs backhaul traffic, expose your internal network, slow down cloud apps, and give users way more access than they need. SASE fixes that by sending users straight to the apps they're allowed to use, securely and efficiently.
Q: How do I Unfork?	A: Replace your VPN with identity-based SASE access.	TPx deploys a lightweight client, connects your identity provider, applies zero-trust policies, and gives your users direct, secure access to what they need. No detours, no exposed network, no forked-up experience.
